

UL 60

UL60 is an atmospheric plasma generator, designed for surface treatment. It can be used for all materials (plastics, glass, metal, fabrics, wood...) of any shape (film, profiles, powder, 3D...).

It is adapted to any existing or future installation, in production as well as in laboratories.

The equipment is made of a 60 mm length source. This source produces radicals and metastables species that are a wonderful chemical energy source for surface treatment dry processes. This technology is patented EP0575260 and FR2692730.

The generator provides electrical power for creating plasma in the source. It is a key component for a good surface treatment. It includes an electronical regulator for power control. Internal protections make equipment use safe. The equipment is controlled by a touch-screen interface.
